### Statistical Natural Language Processing Part of speech tagging

Çağrı Çöltekin

University of Tübingen Seminar für Sprachwissenschaft

Summer Semester 2019

POS tags and tagsets Rule-based and TBL ML appro

### Traditional POS tags

what you learn in (primary?) school

noun apple, chair, book verb go, read, eat adjective blue, happy, nice adverb well, fast, nicely pronoun I, they, mine determiner a, the, some prepositon in, since, past, ago (?) conjunction and, or, since interjection uh, ouch, hey

With minor differences, this list of categories has been around for a long time.

Ç. Çöltekin, SfS / University of Tübingen

Summer Semester 2019 2 / 26

POS tags and tagsets Rule-based and TBL ML approaches

### What are the POS tags good for

- Linguistic theory
- Parsing
- Speech synthesis: pronounce lead, wind, object, insult differently based on their POS tag
- The same goes for machine translation
- Information retrieval: if wug is a noun, also search for wugs
- Text classification: improves some tasks
- As a back-off strategy for some language models

Ç. Çöltekin, SfS / University of Tübingen

POS tags and tagsets Rule-based and TBL ML approaches

### Some issues with traditional POS tags

- Not all POS tags are observed in (or theorized for) all languages
- Often finer granularity is necessary
  - book, water and Mary are all nouns, but
    - The book is here
    - \* The Mary is here
    - We have water
    - \* We have book

### Part of speech tagging

flies like arrow NOUN VERB ADP DET NOUN PUNC

- Part of speech (POS or PoS) tags are morphosyntactic classes of words
- The words belonging to the same POS class share some syntactic and morphological properties

Ç. Çöltekin, SfS / University of Tübingen

POS tags and tagsets Rule-based and TBL ML approaches

### When we say 'traditional' ...

- POS tags in modern linguistics are based on Greek/Latin linguistic traditions
- But others, e.g., Sanskrit linguists, also proposed POS tags

Ç. Çöltekin, SfS / University of Tübinger

POS tags and tagsets Rule-based and TBL ML approaches

### Open vs. closed class words

Open class words (e.g., nouns) are productive

- new words coined are often in these classes
- we often cannot rely on a fixed lexicon
- they are typically 'content' words

Closed class words (e.g., determiners) are generally static

- the lexicon does not grow
- they are typically 'function' words
- This distinction is often language dependent,

Ç. Çöltekin, SfS / University of Tübingen

POS tags and tagsets Rule-based and TBL ML approaches

### POS tagsets in practice example: Penn treebank tagset

Tag	Description	Example	Tag	Description	Example
CC	Coordin. Conjunction	and, but, or	SYM	Symbol	+,%, &
CD	Cardinal number	one, two, three	TO	"to"	to
DT	Determiner	a, the	UH	Interjection	ah, oops
EX	Existential 'there'	there	VB	Verb, base form	eat
FW	Foreign word	mea culpa	VBD	Verb, past tense	ate
IN	Preposition/sub-conj	of, in, by	VBG	Verb, gerund	eating
JJ	Adjective	yellow	VBN	Verb, past participle	eaten
JJR	Adj., comparative	bigger	VBP	Verb, non-3sg pres	eat
JJS	Adj., superlative	wildest	VBZ	Verb, 3sg pres	eats
LS	List item marker	1, 2, One	WDT	Wh-determiner	which, that
MD	Modal	can, should	WP	Wh-pronoun	what, who
NN	Noun, sing. or mass	llama	WP\$	Possessive wh-	whose
NNS	Noun, plural	llamas	WRB	Wh-adverb	how, where
NNP	Proper noun, singular	IBM	\$	Dollar sign	\$
NNPS	Proper noun, plural	Carolinas	#	Pound sign	#
PDT	Predeterminer	all, both	66	Left quote	(' or ")
POS	Possessive ending	's	"	Right quote	(' or ")
PRP	Personal pronoun	I, you, he	(	Left parenthesis	([,(,{,<)
PRP\$	Possessive pronoun	your, one's	)	Right parenthesis	(],),},>)
RB	Adverb	quickly, never	,	Comma	,
RBR	Adverb, comparative	faster		Sentence-final punc	(.!?)
RBS	Adverb, superlative	fastest	1 :	Mid-sentence punc	(: ;)
DD	B 1.4		1	-	

C. Cöltekin. SfS / University of Tübingen

Ç. Çöltekin, SfS / University of Tübingen

• The choice of tagsets depends on the language and

- Differences can be large, for Chinese Penn treebank has  $34\,$ 

• For other languages, the choice varies roughly between

• Example tag set sizes (for English) - Brown corpus, 87 tags Penn treebank 45 tagsBNC, 61 tags

about 10 to a few hundred

tags, but tagsets with about 300 tags exist

### POS tagsets in practice

example 2: STTS tagset

POS	description	examples
KOUI	subordinating conjunction	um [zu leben], anstatt [zu fragen]
KOUS	subordinating conjunction	weil, daß, damit, wenn, ob
KON	coordinative conjunction	und, oder, aber
KOKOM	particle of comparison, no clause	als, wie
NN	noun	Tisch, Herr, [das] Reisen
NE	proper noun	Hans, Hamburg, HSV
PDS	substituting demonstrative	dieser, jener
PIS	substituting indefinite pronoun	keiner, viele, man, niemand
PIAT	attributive indefinite	kein [Mensch], irgendein [Glas]
PIDAT	attributive indefinite	[ein] wenig [Wasser],
PPER	irreflexive personal pronoun	ich, er, ihm, mich, dir
PPOSS	substituting possessive pronoun	meins, deiner
PPOSAT	attributive possessive pronoun	mein [Buch], deine [Mutter]
PRELS	substituting relative pronoun	[der Hund,] der
PRELAT	attributive relative pronoun	[der Mann ,] dessen [Hund]
	*

POS tagset choices

application

POS tags and tagsets Rule-based and TBL ML approache

### Shift towards more 'universal' tag sets

- The variation in POS tagset choices often makes it difficult to
  - compare alternative approaches
  - use the same tools on different languages of data sets
- There has been a recent trend for 'universal' tag sets
- The result is a smaller POS tag set (back to the tradition)
- But often supplemented with morphological features

Ç. Çöltekin, SfS / University of Tübingen

Summer Semester 2019 10 / 26

POS tags and tagsets Rule-based and TBL ML approaches

### Morphological features

- Annotating words with morphological features has been common in (non-English) NLP
- Morphological features give additional sub-categorization information for the word
- For example

nouns typically have number and case feature

verbs typically have tense, aspect, modality voice features

adjectives typically have degree

· Morphological feature sets change depending on the language (typology)

Ç. Çöltekin, SfS / University of Tübingen

POS tags and tagsets Rule-based and TBL ML approaches

### POS tags are ambiguous

Part of speech tagging is essentially an ambiguity resolution problem.

POS tags and tagsets Rule-based and TBL ML approaches

### POS tagsets in recent practice

example: Universal Dependencies tag set

ADJ adjective PART particle ADP adposition PRON pronoun ADV adverb PROPN proper noun AUX auxiliary PUNCT punctuation CCONJ coordinating SCONJ subordinating conjunction conjunction DET determiner SYM symbol INTJ interjection VERB verb NOUN noun NUM numeral X other

Ç. Çöltekin, SfS / University of Tübinge

POS tags and tagsets Rule-based and TBL ML approaches

## Morphological features

an example

flies NOUN VERB num=sing num=sing

pers=3 tense=pres

Time

like ADP

an DET

NOUN def=ind num=sing

arrow

PUNC

Ç. Çöltekin, SfS / University of Tübingen

POS tags and tagsets Rule-based and TBL ML approaches

### POS tag ambiguity

More examples

• Some words are highly ambiguous

ADJ the back door

NOUN on our back ADV take it back

VERB we will back them

- The garden-path sentences are often POS ambiguities
  - The old man the boats
  - The complex houses married and single soldiers and their families

C. Cöltekin. SfS / University of Tübinger

C. Cöltekin. SfS / University of Tübinger

POS tagging can be solved in a number of different methods

• Machine-learning approaches
Typical statistical approaches involve sequence learning

• Rule-based methods: 'constraint grammar' (CG)

#### POS tags and tagsets Rule-based and TBL ML approache

### Rule-based POS tagging typical approach

each word

- Using a tag lexicon, start with assigning all possible tags to
  - · Eliminate tags based on hand-crafted rules
  - Rules typically rely on the words and (potential) tags of the words in the context
  - Result is not always full disambiguation, some ambiguity may remain

 $\bullet\,$  The idea: learn a sequence of rules (similar to CG) using a

· Some probabilistic constraints may also be applied

POS tags and tagsets Rule-based and TBL ML approaches

• The rules transform an initial POS assignment to (approximately) the POS tag assignment in the training

· During test time apply the rules in the same order

Transformation based tagging (TBL)

 Hidden Markov models Conditional random fields

(Recurrent) neural networks

• Transformation based: Brill tagger

Ç. Çöltekin, SfS / University of Tübingen

methods:

Ç. Çöltekin, SfS / University of Tübingen

tagged corpus

POS tags and tagsets Rule-based and TBL ML approaches

### Rule-based POS tagging

POS tagging: strategies

an example

• Among others, the word that can be

SCONJ we know that it is bad ADV it is not that bad

An example rule for disambiguation (simplified):

if the next word is ADJ

and the next word is sentence final 3

and the previous word is not a verb like 'consider'

then eliminate SCONJ else eliminate ADV

> • The rules above prefer SCONJ for cases like I consider that funny.

> > POS tags and tagsets Rule-based and TBL ML approaches

2. Find the best rule that improves the tagging accuracy,

the preceding/following word is tagged z

tagged z and two words before is tagged t

• Rules need to be restricted, often templates are used. For

- the preceding word tagged  $\nu$  and the following word is

the preceding word tagged  $\nu$  and the following word is

1. Start with most likely tags for each word

3. Repeat 2 for all possible rules

example: Change tag x to tag y if

Ç. Çöltekin, SfS / University of Tübingen

Learning in TBL

### POS tags and tagsets Rule-based and TBL ML approaches Transformation based learning

An example

Ç. Çöltekin, SfS / University of Tübingen

- Start with most likely POS tags
- Apply: change NOUN to VERB if preceding word is NOUN and ...
- Apply: change VERB to ADP if preceding word is tagged as VERB
- Stop when none of the rules improve the result

Ç. Çöltekin, SfS / University of Tübingen

POS tags and tagsets Rule-based and TBL ML approaches

### ML methods for POS tagging

Ç. Çöltekin, SfS / University of Tübingen

- POS tagging is a typical example of 'sequence labeling'
- Many of the ML methods introduced earlier can be used for POS tagging
- · Sequence learning methods are more suitable, since the tags depend on the neighboring tags
  - Hidden Markov models (HMMs)
  - Hidden Markov max-ent models (HMMEMs)
  - Conditional random fields (CRFs)
  - Recurrent neural networks (RNNs)

POS tags and tagsets Rule-based and TBL ML approaches

# POS tagging using Hidden Markov models (HMM)

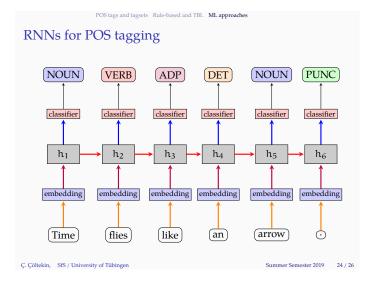

- The tags are hidden
- · Probability of a tag depends on the previous tag
- Probability of a word at a given state depends only on the current tag
- · Parameters of the model can be learned

supervised from a tagged corpus (e.g., MLE) unsupervised using EM (Baum-Welch algorithm)

C. Cöltekin. SfS / University of Tübingen

C. Cöltekin. SfS / University of Tübingen

POS tags and tagsets Rule-based and TBL ML approaches

### **Summary**

- POS is an old idea in linguistics
- POS tags have uses in both linguistics, and practical applications
- Common methods for automatic POS tagging include
  - rule-based
  - transformation-based
  - statistical (more on this next week)

### methods

Move

Mon/Fri Vector representations

Ç. Çöltekin, SfS / University of Tübingen

Summer Semester 2019 26 / 26

POS tags and tagsets Rule-based and TBL ML approaches

### POS tagging accuracy

- $\bullet$  Tagging each word with the most probable tag gives around 90 % accuracy
- • State-of-the art POS taggers (for English) achieve 95  $\%\text{--97}\,\%$
- Human agreement on annotation also seems to be around 97 % : not a lot of space for improvement
  - at least for well-studied resource-rich languages
