#### Çağrı Çöltekin

University of Tübingen Seminar für Sprachwissenschaft

Summer Semester 2019

## Classical NLP pipeline

- Tokenization
- Sentences, (normalized) words, stems / lemmas
- Lexical / morphological processing POS tags, morphological features, stems / lemmas, named entities
- Parsing
- Constituency / dependency trees
- Semantic processing
- word-senses, logical forms Discourse

Co-reference resolution, discourse representation

We do not always use a pipeline, not all steps are necessary for all applications

Ç. Çöltekin, SfS / University of Tübingen

Summer Semester 2019 2 / 21

Tokenization Segmentation

#### But, can't we just tokenize based on spaces?

...and get rid of the punctuation

Some examples from English:

- \$10 billion
- rock 'n' roll
- he's
- can't
- O'Reilly
- 5-year-old • B-52
- C++
- C4.5
- 29.05.2017
- 134.2.129.121
- sfs.uni-tuebingen.de
- New York-based
- wake him up

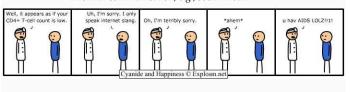

Ç. Çöltekin, SfS / University of Tübingen

Ç. Çöltekin, SfS / University of Tübingen

Tokenization Segmentation

#### Specialized and non-standard text

- More difficult for non-standard text
  - Many specialized terms use a mixture of letters, numbers, punctuation
  - Frequent misspelling, omitting space (e.g., after sentence final punctuation)
- Non-standard text can be
  - Spoken language
  - Old(er) samples of text (e.g., historical records)
  - Specialized domains, e.g., bio-medical texts
  - Informal communication, e.g., social media

Tokenization – a solved problem?

- Typically, we (in NLP/CL/IR/...) process text as a sequence of tokens
- Tokens are word-like units
- A related task is sentence segmentation
- Tokenization is a language dependent task, where it becomes more challenging in some languages
- Tokenization is often regarded as trivial, and a mostly solved task

C. Cöltekin, SfS / University of Tübingen

Tokenization Segmentation

## Tokenization in the classical NLP pipeline

Syntax Semantics Discourse

- Tokenization is the first in the pipeline
- Even for end-to-end approaches, tokenization is often considered given (needs to be done in advance)
- · Errors propagate!

Ç. Çöltekin, SfS / University of Tübingen

Summer Semester 2019 3 / 21

Tokenization Segmentation

## Gets more interesting in other languages

- Chinese: 猫占领了婴儿床 'The cat occupied the crib'
- $German: \ Lebens ver sicher ung sgesells chaft sangestellter$ 'life insurance company employee'
- Turkish: İstanbullulaştıramayabileceklerimizdenmişsiniz 'You were (evidentially) one of those who we may not be able to convert to an Istanbulite'
- · Even more interesting when we need to process 'mixed' text with code-switching

# Normalization

Normalization is a related task that often interacts with tokenization.

- For most applications (e.g., IR) we want to treat the following the same
  - Linguistics linguistics
  - color colour
  - lower case lowercase lower-case
  - Tübingen Tuebingen Tubingen
  - seee see
  - flm film
  - Different date/time formats, phone numbers
- · Most downstream tasks require the 'normalized' forms of the words

Ç. Çöltekin, SfS / University of Tübingen

C. Cöltekin, SfS / University of Tübingen

Summer Semester 2019 7 / 21

So, what is a token? One token or multiple? - John's - New York German: im (in + dem) - Turkish: İstanbullulaştıramayabileceklerimizdenmişsiniz  $\bullet\,$  Answer is language and application dependent · Tokenization decisions are often arbitrary · Consistency is important Ç. Çöltekin, SfS / University of Tübingen Tokenization Segmentation Splitting sentences · Another relevant task is sentence tokenization · For most applications, we need sentence boundaries • Sentence-final markers, [.!?] are useful  $\bullet\,$  But the dot '  $\cdot$  ' is ambiguous: can either be end-of- sentence or abbreviation marker, or both - The U.N. is the largest intergovernmental organisation. - I had the impression he'll be ambassador to U.N. · Again, heuristics along with a list of abbreviations is possible Ç. Çöltekin, SfS / University of Tübingen Summer Semester 2019 10 / 21

Tokenization Segmentation

## Machine learning for word / sentence tokenization

- · Another approach is to use machine learning
- · Label each character in the text with
  - I inside a token
  - O outside tokens

  - B beginning of a token, alternatively to combine word/sentence tokenization
    - $\ \, T\ \, \mbox{beginning of a token}$
    - S beginning of a sentence
- How do we create the training data?
- · What are the features for the ML?

Ç. Çöltekin, SfS / University of Tübingen

Tokenization Segmentation

#### I/O/B tokenization example

with sentence boundary markers

The U.N. is the largest intergovernmental  $% \left( 1\right) =\left( 1\right) \left( 1\right)$ 

organisation. I had the impression he'll be

TIIIIIIIIIIIOOSOTIIOTIIOTIIIIIIIIIIOTITIIOTIO

ambassador to U.N. TIIIIIIIIIIOTIOTIIIO

## Rule based tokenization

Regular expressions and finite-state automata

- The 'easy' solution to the tokenization is rule-based
- · Using regular expressions,
  - we can define regular expressions for allowed tokens
  - split after match, disregard/discard the remaining parts
- For example,
  - All alphabetic characters, word, [a-z]+

  - Capitalization, *John*, [A-Z]?[a-z]+Abbreviations, *Prof.*, [A-Z]?[a-z]+[.]?
  - Numbers too, 123, [A-Z]?[a-z]+[.]?|[0-9]+
  - Numbers with decimal parts [A-Z]?[a-z]+[.]?[0-9.]+
- Result is typically imprecise, difficult to maintain

Ç. Çöltekin, SfS / University of Tübingen

## Problems with rule-based approaches

- Rule-based approaches are (still) common in practice,
  - it is difficult to build a rule set that works well in practice
  - it is difficult to maintain
  - it is not domain or language general: needs re-implementation, re-adjustment for every case

Ç. Çöltekin, SfS / University of Tübingen

Tokenization Segmentation

## I/O/B tokenization: an example

The U.N. is the largest intergovernmental 

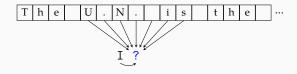

organisation. I had the impression he'll

BIIIIIIIIII00B0BII0BII0BIIIIIIIII0BIBII0BI0

ambassador to U.N. BIIIIIIIIIOBIOBIIIO

Ç. Çöltekin, SfS / University of Tübingen

#### Features for tokenization

- · We predict label of each character
- Typical features are the other characters around the target
- · Choice of features and the machine learning method vary
- Using the previous prediction is also useful

C. Cöltekin. SfS / University of Tübingen

C. Cöltekin. SfS / University of Tübingen

Tokenization Segmentation Segmentation • Segmentation is a related problem in many areas of computational linguistics In some languages, the word boundaries are not marked 猫占领了婴儿床 → 猫 占领 了 婴儿床 - We often want to split words into their morphemes

Supervised segmentation

• I/O/B tokenization is applicable to segmentation as well

Often produces good accuracy

• The main drawback is the need for labeled data

Tokenization Segmentation

• Some unsupervised with reasonable accuracy also exist

· In some cases, unsupervised methods are useful and favorable

Ç. Çöltekin, SfS / University of Tübingen

C. Cöltekin, SfS / University of Tübingen

Tokenization Segmentation

## A simple 'unsupervised' approach

Using a lexicon, segment at maximum matching lexical

Tokenization Segmentation

 $Lebens versicherungsgesellschaftsangestellter \rightarrow$ 

Leben+s+versicherung+s+gesellschaft+s+angestellter

In spoken language there are no reliable word boundaries

- Serves as a good baseline, but fails in examples like theman

where maximum match suggests segmentation 'them an'

- The out-of-vocabulary words are problematic
- One can use already known boundaries as signal for supervision
  - Known to work especially well for sentence segmentation, (e.g., using cues .?!)

Unsupervised segmentation

- Two main approaches
  - Learn a compact lexicon that maximizes the likelihood of the data

$$P(s) = \prod_{i=1}^{n} P(w_i)$$

$$P(w) = \begin{cases} (1-\alpha)f(w) & \text{if } w \text{ is known} \\ \alpha \prod_{i=1}^m P(\alpha_i) & \text{if } w \text{ is unknown} \end{cases}$$

- Segment at points where predictability (entropy) is low The general idea: the predictability within words is high, predictability between words is low

Ç. Çöltekin, SfS / University of Tübingen

Summer Semester 2019 18 / 21

Tokenization Segmentation

## Next

Mon POS tagging

Ç. Çöltekin, SfS / University of Tübingen

Summary

• Tokenization is an important part of an NLP application

Tokenization Segmentation

- · Tokens are word-like units that are
  - linguistically meaningful
  - useful in NLP applications
- Tokenization is often treated as trivial, has many difficulties of its own
- · White spaces help, but does not solve the tokenization problem completely
- Segmentation is tokenization of input where there are no boundary markers
- Solutions include rule-based (regex) or machine learning approaches

Ç. Çöltekin, SfS / University of Tübingen

Ç. Çöltekin, SfS / University of Tübingen

### Some extra: modeling segmentation by children NLP can be 'sciency', too

- An interesting application of unsupervised segmentation methods is modeling child language acquisition
- · How children learn languages has been one of the central topics in linguistics and cognitive science
- Computational models allow us to
  - test hypotheses
  - create explicit models
  - make predictions

C. Cöltekin, SfS / University of Tübingen

· No clear boundary markers

• No lexical knowledge

## How do children segment? – a bit of psycholinguistics

Children very early in life (8-months) seem to be sensitive to statistical regularities between syllables (Saffran, Aslin, and Newport 1996)

Training: bidakupadotigolabubidakugolabupadoti... test G2: non-words P(da | bi) = 1 $P(pa \mid bu) = \frac{1}{3}$ 

Children showed preference towards the 'words' that are used in the training phase.

Ç. Çöltekin, SfS / University of Tübinger

pagolabidotikugobdalaubu...

## Predictability

Predictability within units is high, predictability between units is low.

Given a sequence 1r, where 1 and r are sequences of phonemes:

- If 1 help us predict r, 1r is likely to be part of a word
- If observing r after 1 is surprising it is likely that there is a boundary between 1 and r

The strategy dates back to 1950s (haris1955), where he used a measure called successor variety (SV):

The morpheme boundaries are at the locations where there is a high variety of possible phonemes that follow the initial segment.

Ç. Çöltekin, SfS / University of Tübingen

#### How to calculate the measures

padotibidakugolabupadoti..

$$P(6|\&t) = 0.03$$

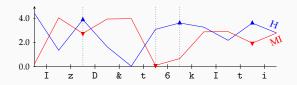

Calculations are done on a corpus of child-directed English

Ç. Çöltekin, SfS / University of Tübingen

## An unsupervised method

• An obvious way to segment the sequence is using a threshold value. However, the choice of threshold is difficult in an unsupervised system.

A simple unsupervised method: segment at peaks/valleys.

Ç. Çöltekin, SfS / University of Tübinger
